

Multinational Imaging and Optical Manufacturer Reduces Global Phishing Exposure with PhishMe

Background

Phishing attacks spiked a whopping 55% in 2015 alone. Recognizing their employees were vulnerable to phishing attacks, a multinational manufacturer of imaging and optical products with more than 18,000 employees in the EMEA region concluded it was only a matter of time before a phishing attack would cause serious damage.

Security Challenges

Phishing is successful because it baits users to open tainted emails that often bypass stringent technology layers to reach the user's inbox. Employees can be too busy, distracted or trusting to give much thought to possible risks.

"There's always a way to penetrate the organization, or use an employee to get access because, for employees, security is not normally their area of expertise," says the Information Security Manager at the global manufacturer. "If they see an email, they may not be able to recognize it as legitimate or malicious."

The company decided to strengthen its phishing defenses since most of its efforts to raise awareness about phishing through video and classroom presentations so far had proven unsatisfactory, the company turned to PhishMe to help strengthen their anti-phishing programs. "The whole concept of phishing as a service just struck us as genius."

Solutions – PhishMe Simulator™ and PhishMe Reporter™

The relationship started with an implementation of PhishMe Simulator, an enterprise SaaS solution that drastically reduces an organization's phishing susceptibility by conditioning users to recognize and avoid phishing threats using simulated phishing scenarios and immediate education.

PhishMe Simulator was highly successful in conditioning the company's employees to recognize phishing attempts. The next logical step was to turn the employees into informants with PhishMe Reporter, an add-on module which empowers employees to report phishing attempts to strengthen organizational response.

Looking ahead, the client is currently testing the PhishMe Triage solution, a dedicated incident response platform which automatically organizes and analyzes suspected phishinges to help IR

teams more quickly respond to attacks in progress.

Gaining Global Adoption Among 18,000 Users

To test the waters with PhishMe Simulator, the client deployed it to about 5,500 employees and spent a year analyzing the results. Satisfied the solution worked as promised, with users getting wiser to the tricks and techniques of phishing, the company decided to expand PhishMe coverage to all 18,000 employees.

The company runs simulations once each quarter for all employees, and increases the frequency for smaller groups needing additional help with threat detection. Each time, the company uses a different phishing scenario to “keep users on their toes”. Some scenarios come stock with the solution, but clients can create their own.

“We’ve almost always customized the scenarios to an extent, and we did a couple that were fully customized,” notes the client. “PhishMe keeps updating scenarios based on events that occur in the real-world, and we find that really helps.”

One of the most compelling aspects of PhishMe Simulator, he says, is ease of implementation. Ten minutes after deploying the software, you can start using it. PhishMe’s atypical, proactive approach to phishing defense is also a major benefit, as is the statistics-generating capability to deliver a true picture of user awareness levels, he says.

Improved Reporting Capabilities

The company has rolled out PhishMe Reporter to the 18,000 employees to encourage not only vigilance but active participation in security. “Before PhishMe, it was difficult to get people, when they received a phishing email, to send in the email attachment. Some people don’t understand the concept of sending email as an attachment to maintain the original headers. PhishMe Reporter solved that because now you just press a button to send them.” There was an immediate and significant increase in the number of emails reported as suspicious

The client is currently receiving more phishing reports than it can handle, the manager says. Although the bulk phishing data adds risk for false positives, the client believes that adding an additional incident response tool like PhishMe Triage will help reduce false positives and continue to strengthen their overall security posture.

PhishMe Triage, he says, will help solve the problem of over-reporting by weeding out false positives more efficiently. Employees who send a report will get a response telling them which were false positives and which were real events. That will help the employees get even better at identifying real phishing threats.

The PhishMe solution is essential to achieving his top goals for the year – to effectively address the phishing problem and raise employee awareness. Part of the reason phishing is such a vexing threat, he believes, is because no one ever thinks to fully train users on how to properly use email.

“No one really shows them what is good versus what is bad and how to make that determination. It’s hard to break bad habits through just videos or pamphlets and some don’t care because they suffer from information overload,” he shares. “A solution like PhishMe shows them in real-time what a real phish looks like and does.”

Conclusion – “Buy PhishMe”

The client’s ability to catch phishing emails has vastly improved since implementing PhishMe Simulator and PhishMe Reporter. According to the client, PhishMe’s technical support has remained accessible and responsive throughout the adoption process. “They give results in a couple of hours and they’re very nice people – all of them.”

The client notes that compared with other vendors getting support from PhishMe is definitely easier. Based on that success, and the technology’s tangible results. The Information Security Manager says he’d have no qualms about recommending PhishMe to his peers.

When anyone asks him how to deal with phishing, his answer is simple: “Buy PhishMe.”

About PhishMe

PhishMe® is the leading provider of threat management for organizations concerned about human susceptibility to advanced targeted attacks. PhishMe’s intelligence-driven solutions empower employees to be an active line of defense by enabling them to identify, report, and mitigate spear phishing, malware, and drive-by threats. Our open approach ensures that PhishMe integrates easily into the security technology stack, delivering measurable results to help inform and adapt an organization’s security programs. PhishMe’s customers include the defense industrial base, energy, financial services, healthcare, and manufacturing industries, as well as other Global 1000 entities that understand changing user security behavior will improve security, aid incident response, and reduce the risk of compromise.
